Identify SNP associated with eight CH₄ traits in Danish Holstein cattle and determine if there are SNP in common controlling these methane traits

Materials and Methods

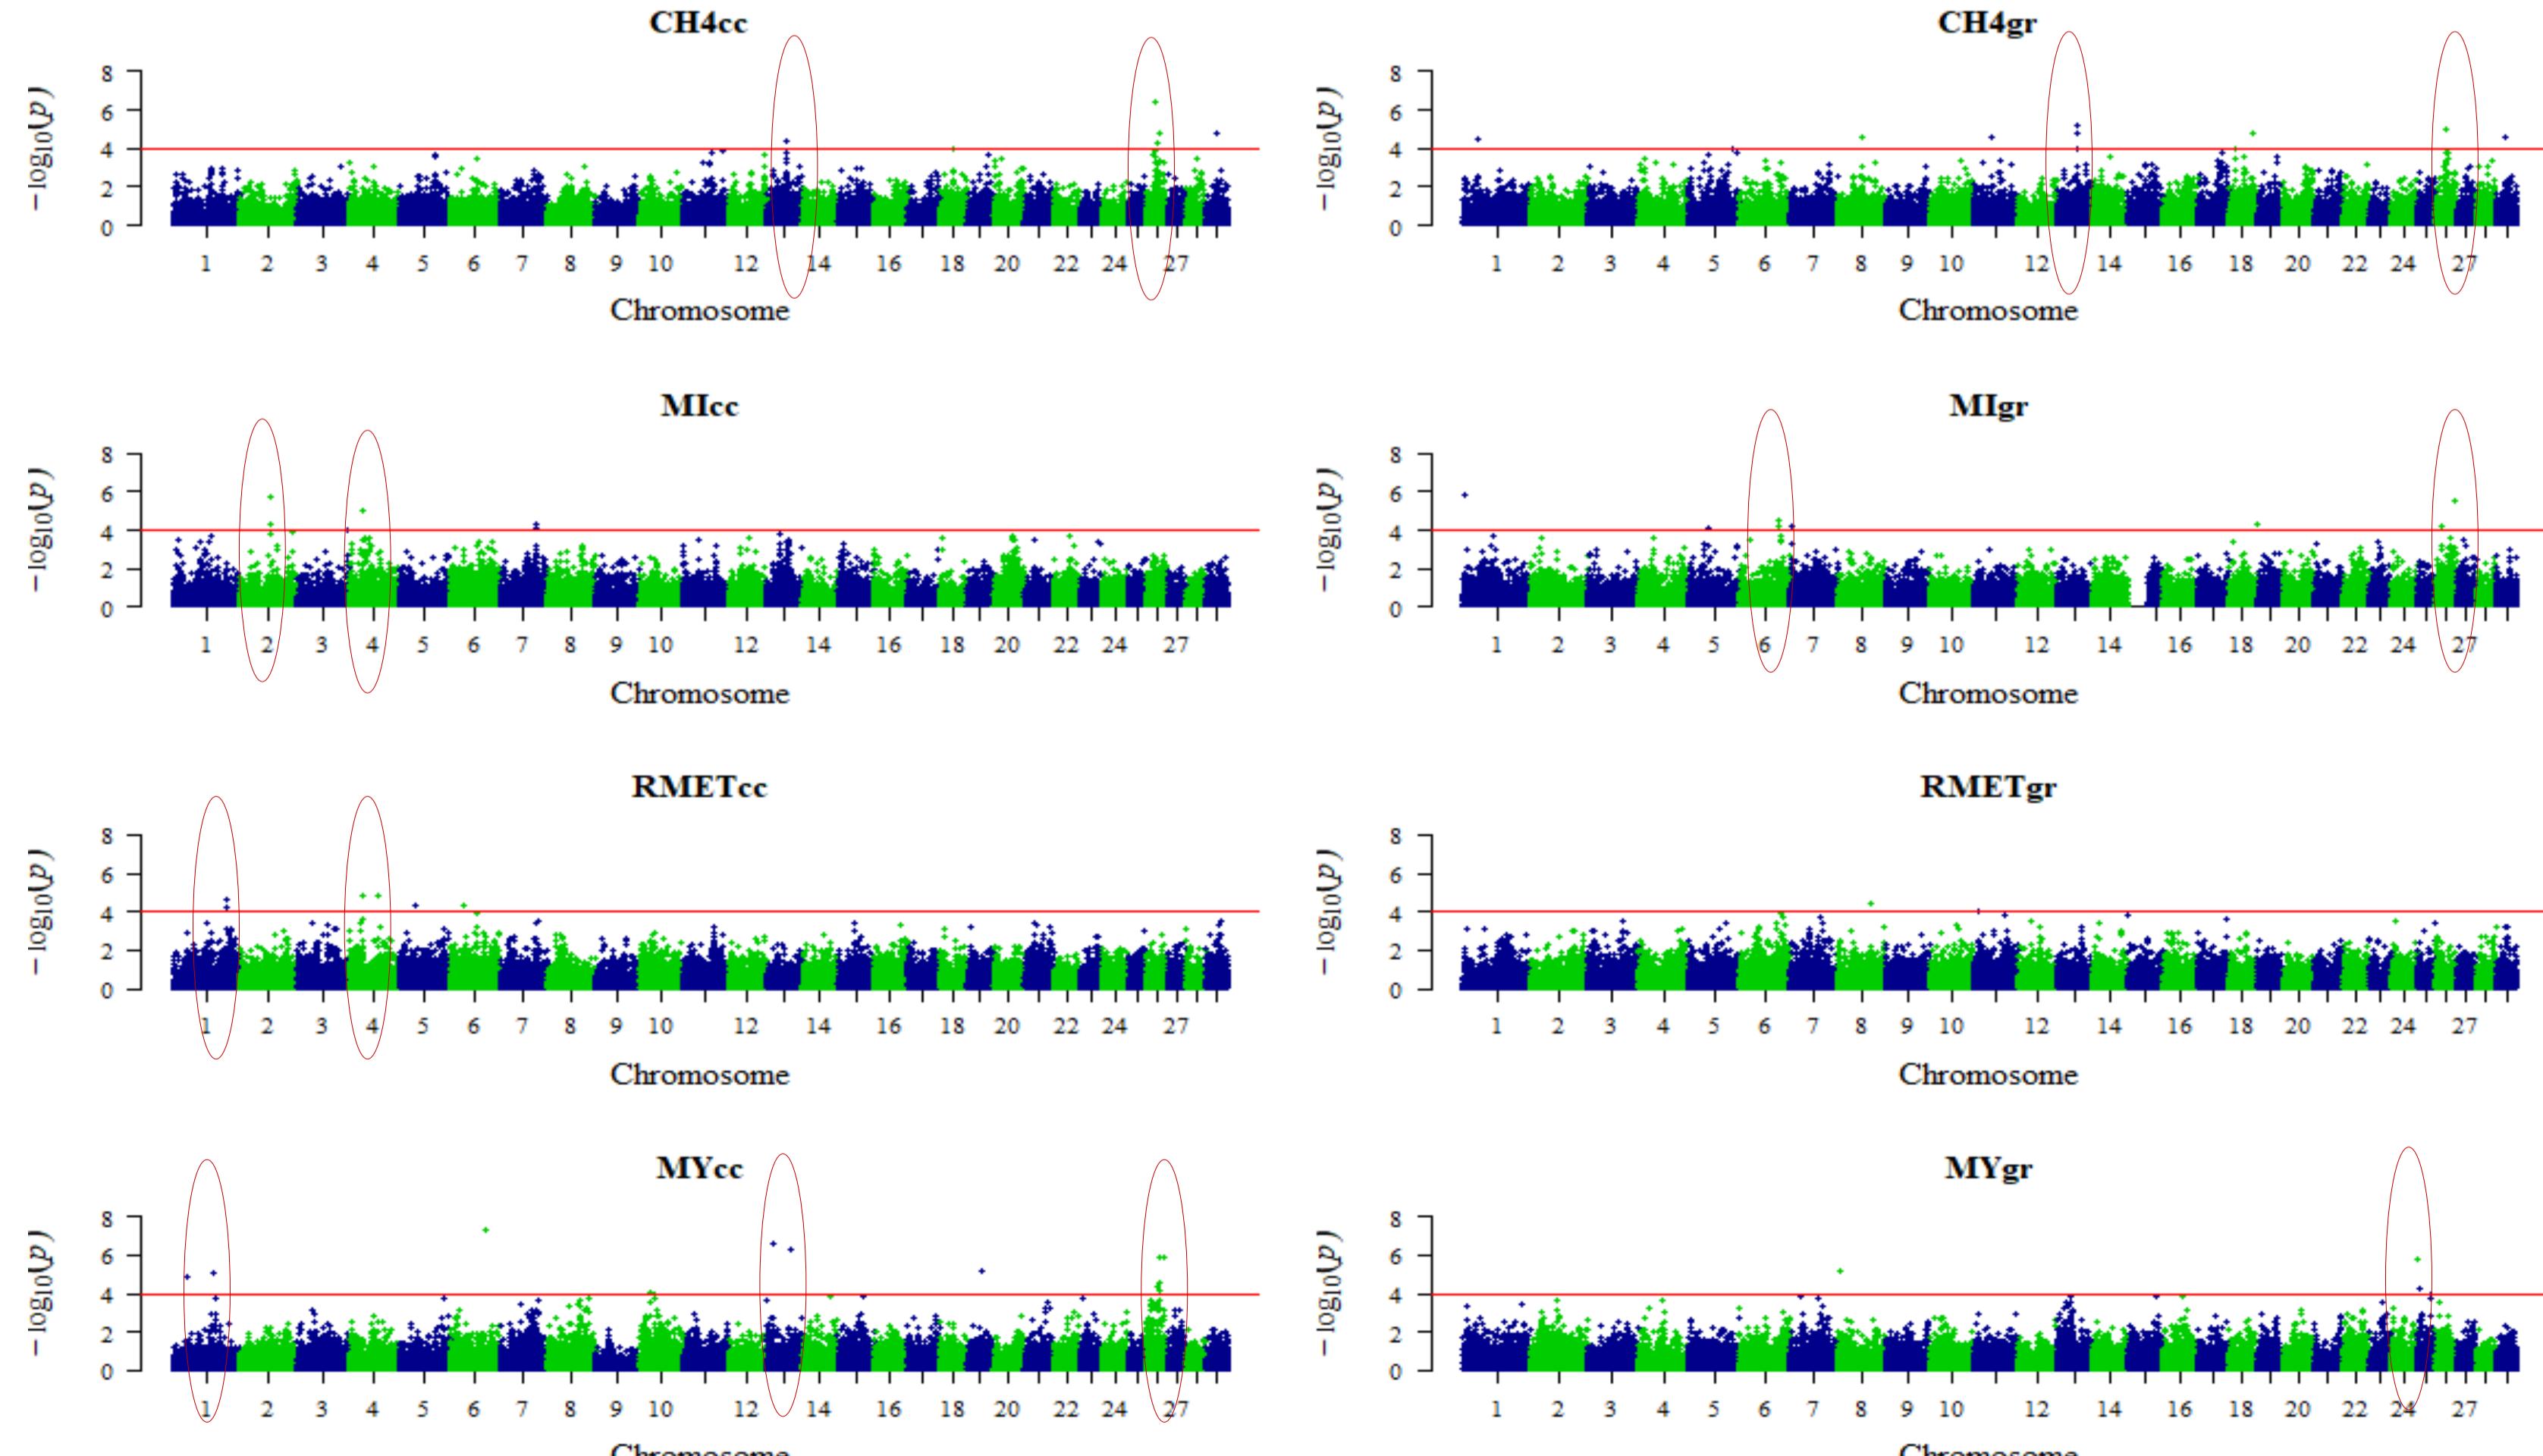

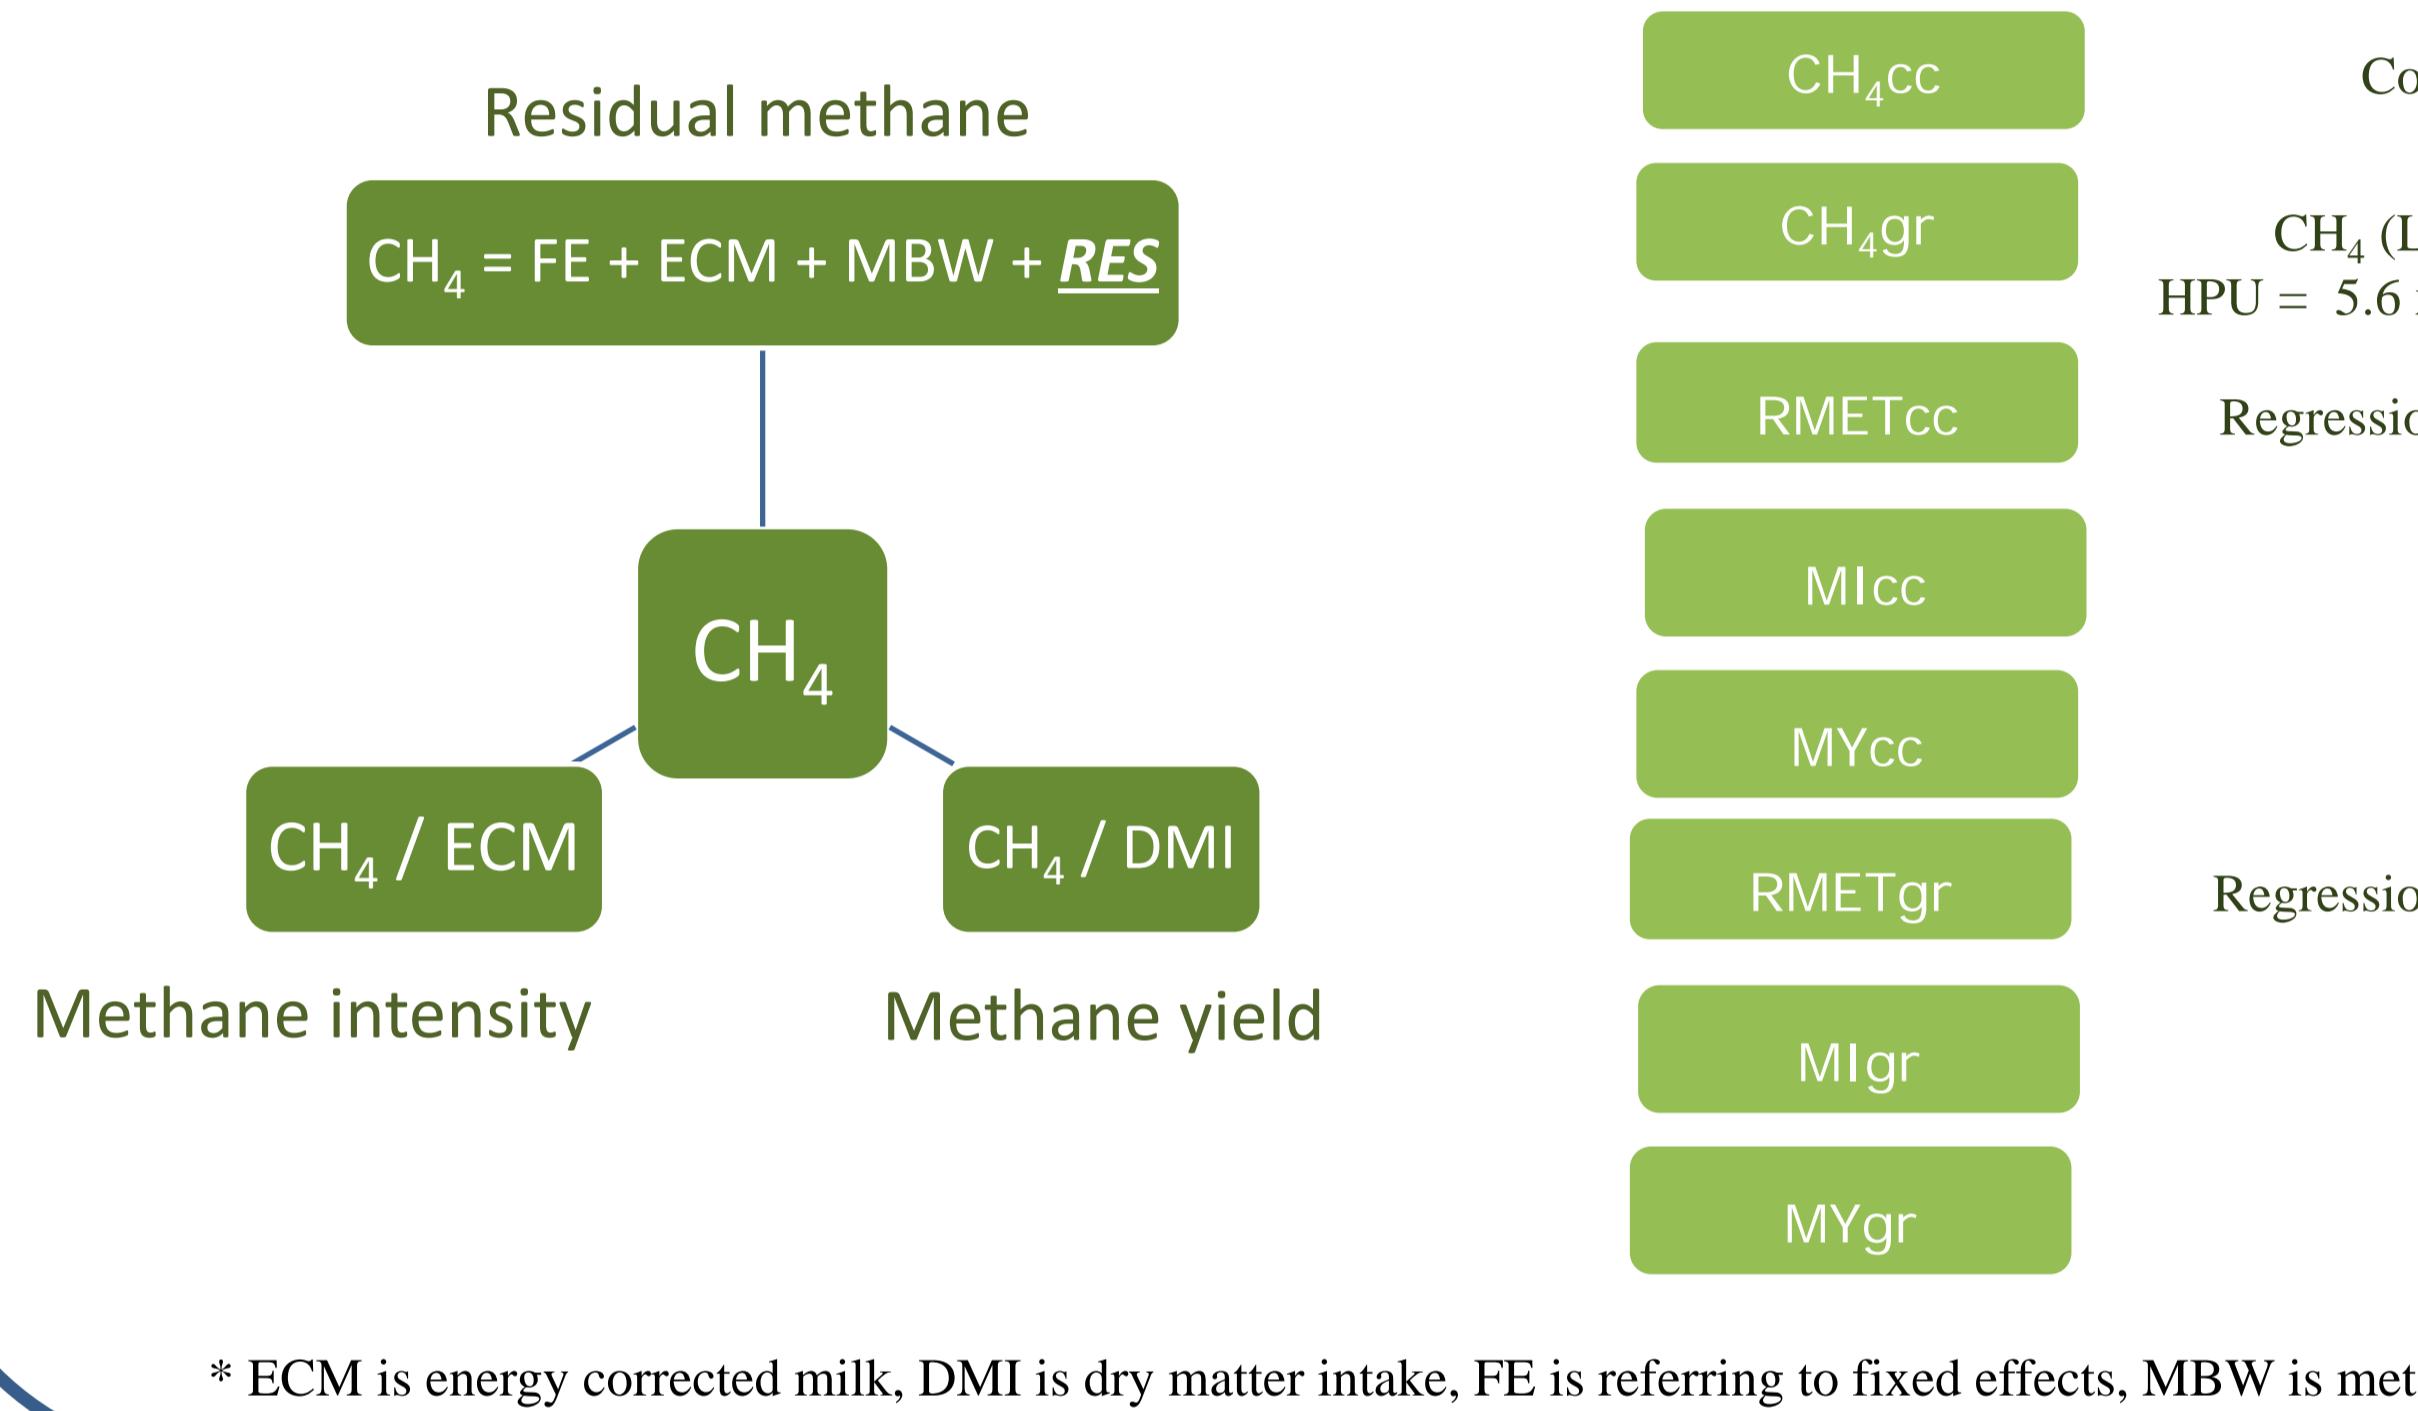

Figure 1. Genome-wide association plots ($-\log_{10}(P)$) of methane concentration (CH₄gr), methane grams (CH₄cc), methane intensity concentration (MIcc), methane intensity grams (Migr), residual methane concentration (RMETcc), residual methane grams (RMETgr), methane yield concentration (MYcc), methane yield grams (MYgr) performed on 1,900 animals with repeated records. The genomewide significance level is set at 10×10^{-5} and is plotted as the red line.

Segments of 1mbp significantly associated to each trait (diagonal; $P < 0.01$ / $P < 0.001$) and between traits ($P < 0.01$ below the diagonal, $P < 0.001$ above the diagonal).

Traits	CH ₄ cc	CH ₄ gr	MIcc	Migr	RMETcc	RMETgr	MYcc	MYgr
CH ₄ cc	248 / 34	17	1	1	0	0	5	1
CH ₄ gr	145	362 / 54	1	2	0	0	3	0
MIcc	34	48	301 / 54	4	4	1	2	0
Migr	40	65	89	316 / 37	0	0	5	1
RMETcc	26	47	39	35	299 / 35	1	3	1
RMETgr	34	45	35	39	36	299 / 37	0	1
MYcc	37	53	39	52	38	39	280 / 52	1
MYgr	58	70	55	55	37	34	58	308 / 33

■ Significant segments in common within trait pairs (RMET, MI, MY).

Genetic correlations between trait pairs			
$\text{CH}_4\text{gr} - \text{CH}_4\text{cc} = 0.82$		$\text{Migr} - \text{MIcc} = 0.43^*$	
$\text{RMETgr} - \text{RMETcc} = 0.65^*$		$\text{MYgr} - \text{MYcc} = 0.78^*$	
*SE between 0.14 to 0.23			

SNP significantly associated to two traits ($P < 0.001$), chromosome and position (bp)

Main findings

CH₄cc and CH₄gr had the highest number of significant segments and SNP in common

Given its genetic correlation CH₄cc is closer related to CH₄gr than the other trait pairs

RMET, MI, and MY seem to be different traits and they can not be used interchangeable
