## 1. OBJECTIVES

Disease caused by *Aeromonas hydrophila* bacteria known as Bacterial Necrosis of Pangasids (BNP) have caused significant economic losses in catfish farming. Genetic selection provides a cost-effective option to develop disease resistance lines of catfish to sustain the aquaculture sector.

White spots on liver & spleen

Main aim of the study was to:

- a) To understand genetic inheritance of disease resistance traits in striped catfish;
- b) To understand population structure of striped catfish to strengthen genetic variation for disease resistance selection;
- c) To examine genetic architecture of the disease at molecular genetic and genomic levels.

## 2. METHODS

**Pathogen:** Bacterial isolates were identified and tested for their virulence and susceptibility by biochemical and challenge tests.

**Study design:** Approximately 100 full- and half-sib families in G0 and G1 were available for both challenge and growth on tests.

**Endpoints/assays:** disease resistance, infatigability syndrome, survival at harvest and body weight with over 5,000 observations each generation.

**Genetic evaluation:** 12 individual per family of low (20) and high (20) resistance to disease were available.

**Genotype separation:** we use low density sequencing and imputing to missing genotypes using siblings and parental genotypes.

**Methodology:** Multi-trait deep learning approach with Bayesian multi-omics up genomic framework.

## MAIN FINDINGS SO FAR

We report genetic parameters for BNP resistance in striped catfish that are of practical significance for this species. Our main findings included heritability for BNP resistance, genetic correlations between BNP resistance and growth performance. There is abundant genetic variation in BNP resistance in Thai catfish with the heritability estimate ranging from 0.10 to 0.45, indicating that there are great prospects to improve this trait through genetic selection. The genetic correlations of BNP resistance with growth traits were moderate and positive (0.25 – 0.29), giving possibilities for improving both traits simultaneously. We also found one wild population from Thailand which had distinct genetic characteristics and is valuable genetic resource for genetic improving program.

## GENOMIC STUDIES

Future genomic studies have three main aims: (i) to identify genes or SNP associated with BNP disease; (ii) increase the accuracy of breeding value estimation; and (iii) to build up a linkage map in striped catfish.

## ACKNOWLEDGMENT

The study was funded by Ministry of Science and Technology, Vietnam (grants R.2021.1.23). Support Thanh Vu to attend a joint scholarship from Ministry of Education (Vietnam) and University of the Sunshine Coast, Australia (USC) scholarship for international PhD students.

Striped catfish (*Pangasianodon hypophthalmus*) is the most important freshwater fish for aquaculture in Mekong Delta of Vietnam

Breeding scheme to improve disease resistance in striped catfish

Striped catfish accounts 2-4% of total GDP total value of 1.8 billion US\$ in 2017.

## 3. STATISTIC ANALYSIS

The mathematical equation used to analyze the disease resistance (Y) using multi-trait is that as the [2] were:

$$Y = \mu + \beta_1x + \beta_2y + \beta_3z + \beta_4w + \beta_5v + \beta_6u$$

$$Y = \mu + \beta_1x + \beta_2y + \beta_3z + \beta_4w + \beta_5v + \beta_6u + \beta_7v + \beta_8u$$

The variance components obtained from linear model were used to calculate heritability, genetic correlation for traits studied.

## 4. RESULTS

Figure 1: Variation in BNP resistance phenotype among 177 families in G0

Trait	G0	G1	G2	G3	G4	G5	G6	G7	G8	G9	G10
Resistance (survival)	0.08	0.12	0.15	0.18	0.22	0.25	0.28	0.32	0.35	0.38	0.42
	0.15	0.22	0.28	0.35	0.42	0.48	0.55	0.62	0.68	0.75	0.82
	0.22	0.30	0.38	0.45	0.52	0.60	0.68	0.75	0.82	0.90	0.98
Growth (body weight)	0.02	0.03	0.04	0.05	0.06	0.07	0.08	0.09	0.10	0.11	0.12
	0.05	0.07	0.09	0.11	0.13	0.15	0.17	0.19	0.21	0.23	0.25
	0.08	0.10	0.12	0.14	0.16	0.18	0.20	0.22	0.24	0.26	0.28
Heritability	0.10	0.12	0.15	0.18	0.22	0.25	0.28	0.32	0.35	0.38	0.42
